

# MAAP Releases the Biomass Dashboard

## *Multi-Mission Algorithm and Analysis Platform*

- MAAP is an open-source science tool jointly managed by NASA and the European Space Agency (ESA) that provides seamless access to NASA and ESA data and enables scientists to collaboratively analyze large volumes of data at scale.
- An initial application focuses on above-ground biomass: the size and carbon content of Earth's forests. Understanding biomass distribution and change is critical to understanding the global carbon cycle and global climate change.
- The MAAP dashboard offers a new way for users to visualize biomass products within the platform and makes it possible to curate stories around regions or topics of interest relevant to biomass change.
- The NASA MAAP data team, led by IMPACT, provides many capabilities to help users more effectively find and use data within the MAAP.
